Oil Spill Eater II (OSE II) is the worlds most environmentally safe, easy to use cost effective first response bioremediation process for the mitigation of hydrocarbon and hazardous waste spills. OSE II is an environmentally safe clean up method,

since it utilizes natures own processes to effectively eliminate hazardous materials. OSE II is easy to use and will reduce clean up costs, since OSE II is a one time application. OSE II also reduces cost by cleaning up a spill in place with nothing to move or haul off; OSE II does not create secondary clean up problems normally associated with other clean up products or processes. OSE II is listed on the US EPA National Contingency Plan for Oil Spills (NCP) List. OSE II has a national stock number from US Defense Logistics since 1992. OSE II has been used by all 5 branches of the US Military since 1989, and OSE II has cleaned up over 13000 spills since then and over 4000 spills were on fresh or ocean water. See OSE II at www.osei.us and see our pictorials of spills all over the world, and see our comprehensive 223 page technical package. OSE II is simply the most experienced easy to use, safe, cost effective means to permanently clean up a spill.

OSE II has demonstrated successful cleanups of spills including brackish water, ocean water, fresh water and even intertidal areas just to name a few.
