Pig Farm Test Of Manure Treated With OSE II

A laboratory test with OSE II being applied in three different ratios were carried out in Chile. The tests at the conclusion of the test showed OSE II was effective at all three ratios to reduce the nitrogen levels to the acceptable level in Chile.

There is an attached video link that shows in less than 24 hours the smell of the manure and its ability to adhere to anything or to hold together in its original consistency, was eliminated quickly.
